Area 5

Closed around 2016 due to invasive species and poor road condition. Road is mostly below grade native silt loam soil surface and is typically wet most of the year. These roads are not capable of supporting anything other than intermittent traffic. Road density of this block is significantly higher than what is needed for harvesting operations and abandonment several segments is recommended in this area. If these road were reopened to traffic impacts likely are significant spread of invasive species primarily garlic mustard and likely sever road damage. Due to the below grade construction and past road damage many of these segments are not usable for trucking operations during harvesting without significant road work and likely addition of aggregate binder. The maximum non-motorized access distance for county lands accessed from these road is approximately 2,000 ft.
